

Flow-Fish Richness Relationships

Pee Dee RBC, April 25th, 2023

Drs. Luke Bower, Joe Mruzek, and Brandon Peoples

Identify relationships: some are informative

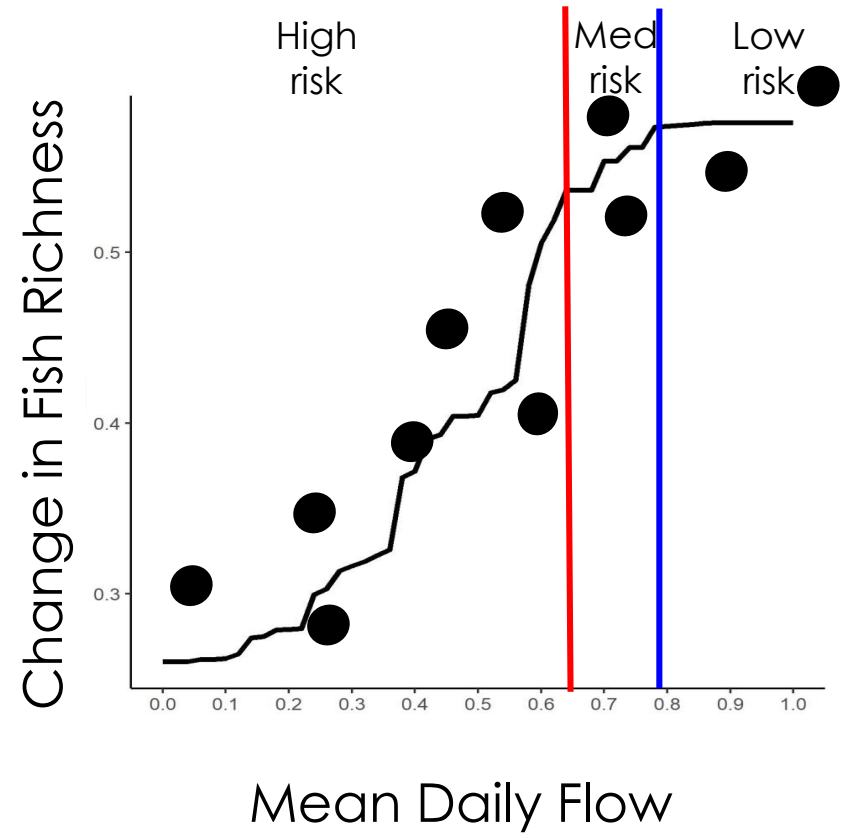

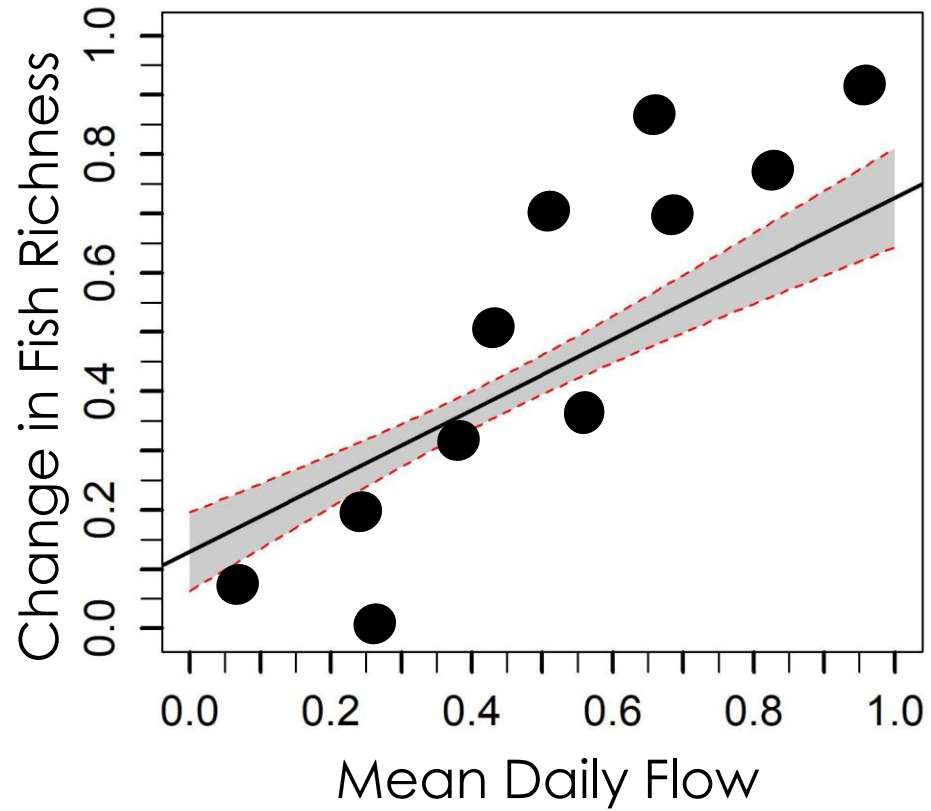

Identify relationships: some are informative

Mean annual flow

How can we use these relationships?

- Defining biological response limits
 - Searching for zones along flow gradients that induce changes in the biological metric
- Predicting responses
 - If we alter flow by X amount what will be the biological response?

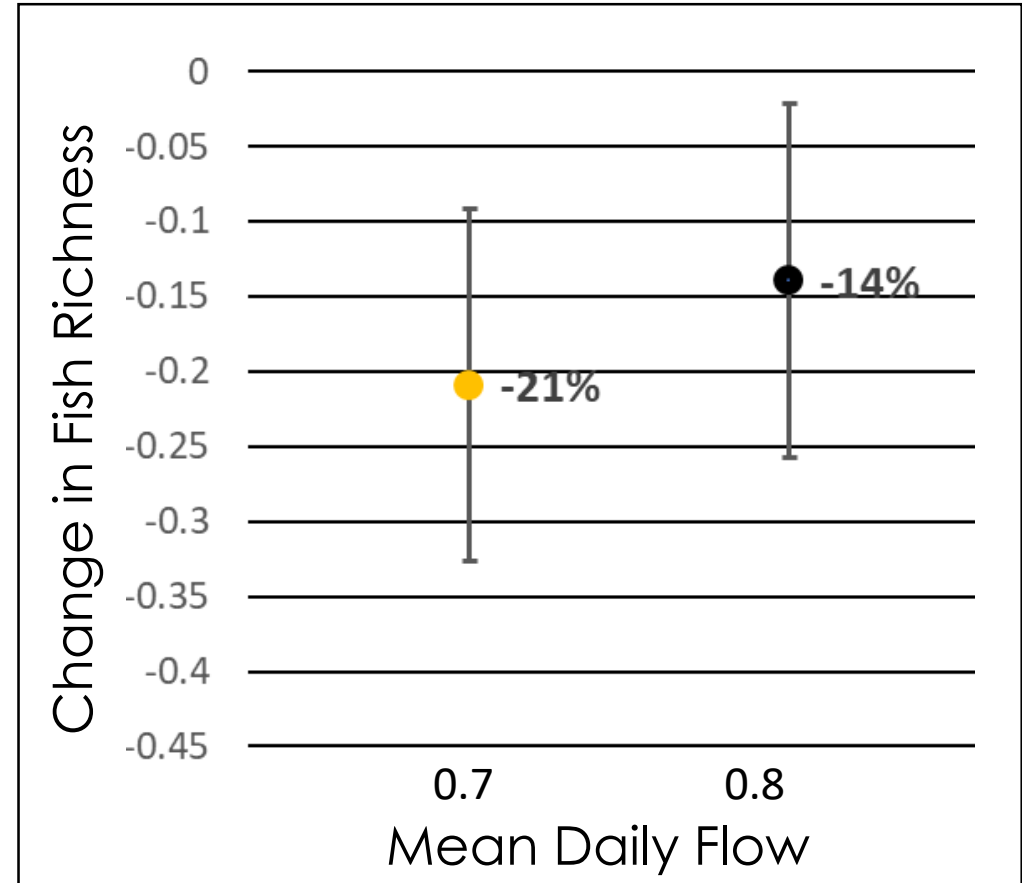

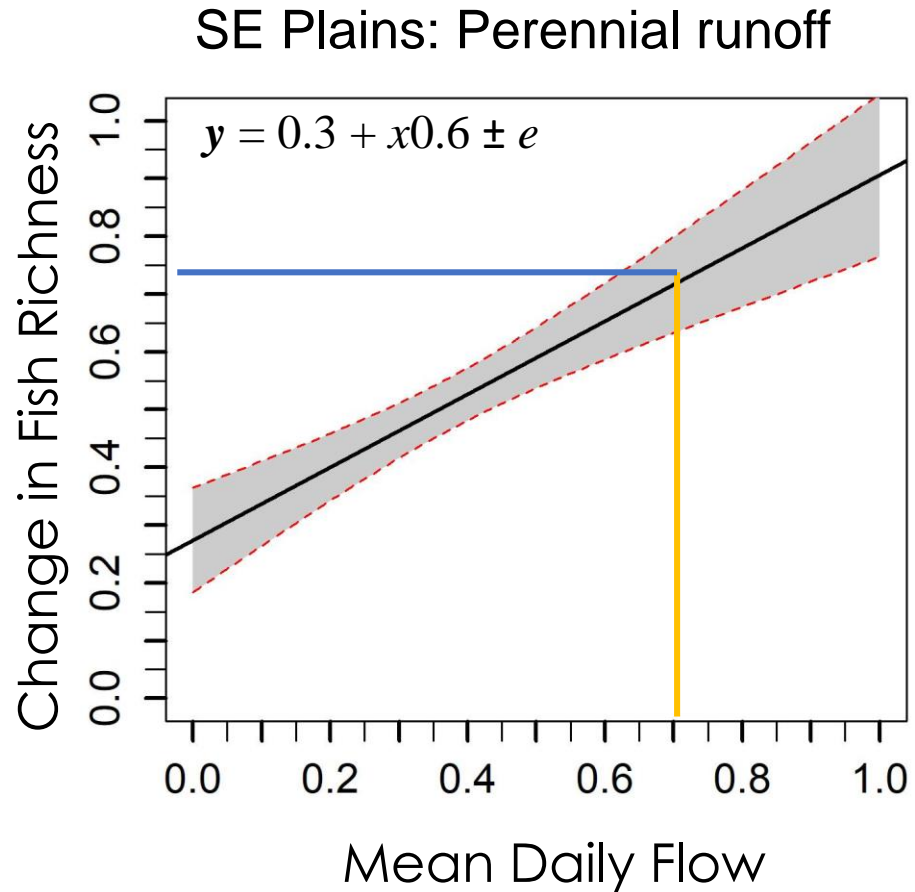

Mean daily flow (MA1): biological response limits

- Lines defined by working group
- Performance measure

Mean daily flow (MA1): predictions

SWAM: 100 cfs to 70 cfs in 2070

Stream classes

- Perennial runoff streams, characterized by moderately stable flow and distinct seasonal extremes (Class 1, 615 stream segments)

- Stable baseflow streams: characterized by high precipitation, sustained high baseflows, and moderately high run-off (Class 3, 183 stream segments)

- Perennial flashy; characterized by moderately stable flow with high flow variability (coefficient of variation in daily flows) (Class 4, 138 stream segments)

Key to Understanding the Results of the Surface Water Modeling Scenarios:

Mean daily flow (MA1): N. Pacolet near Fingerville

Scenario	Current	Predicted	% change	Bio Metric	Change in Bio	SE
UIF	320	368.91	15.4%	Richness	12.7%	7
HD 2070	320	257.78	-19.4%	Richness	-15.9%	7
Full	320	227.65	-28.8%	Richness	-23.6%	7
MD 2070	320	283.39	-11.3%	Richness	-9.3%	7

Current Use Scenario Mean Daily Flow

Scenario Mean Daily Flows

% Changes for each scenario are relative to the Current Use Scenario

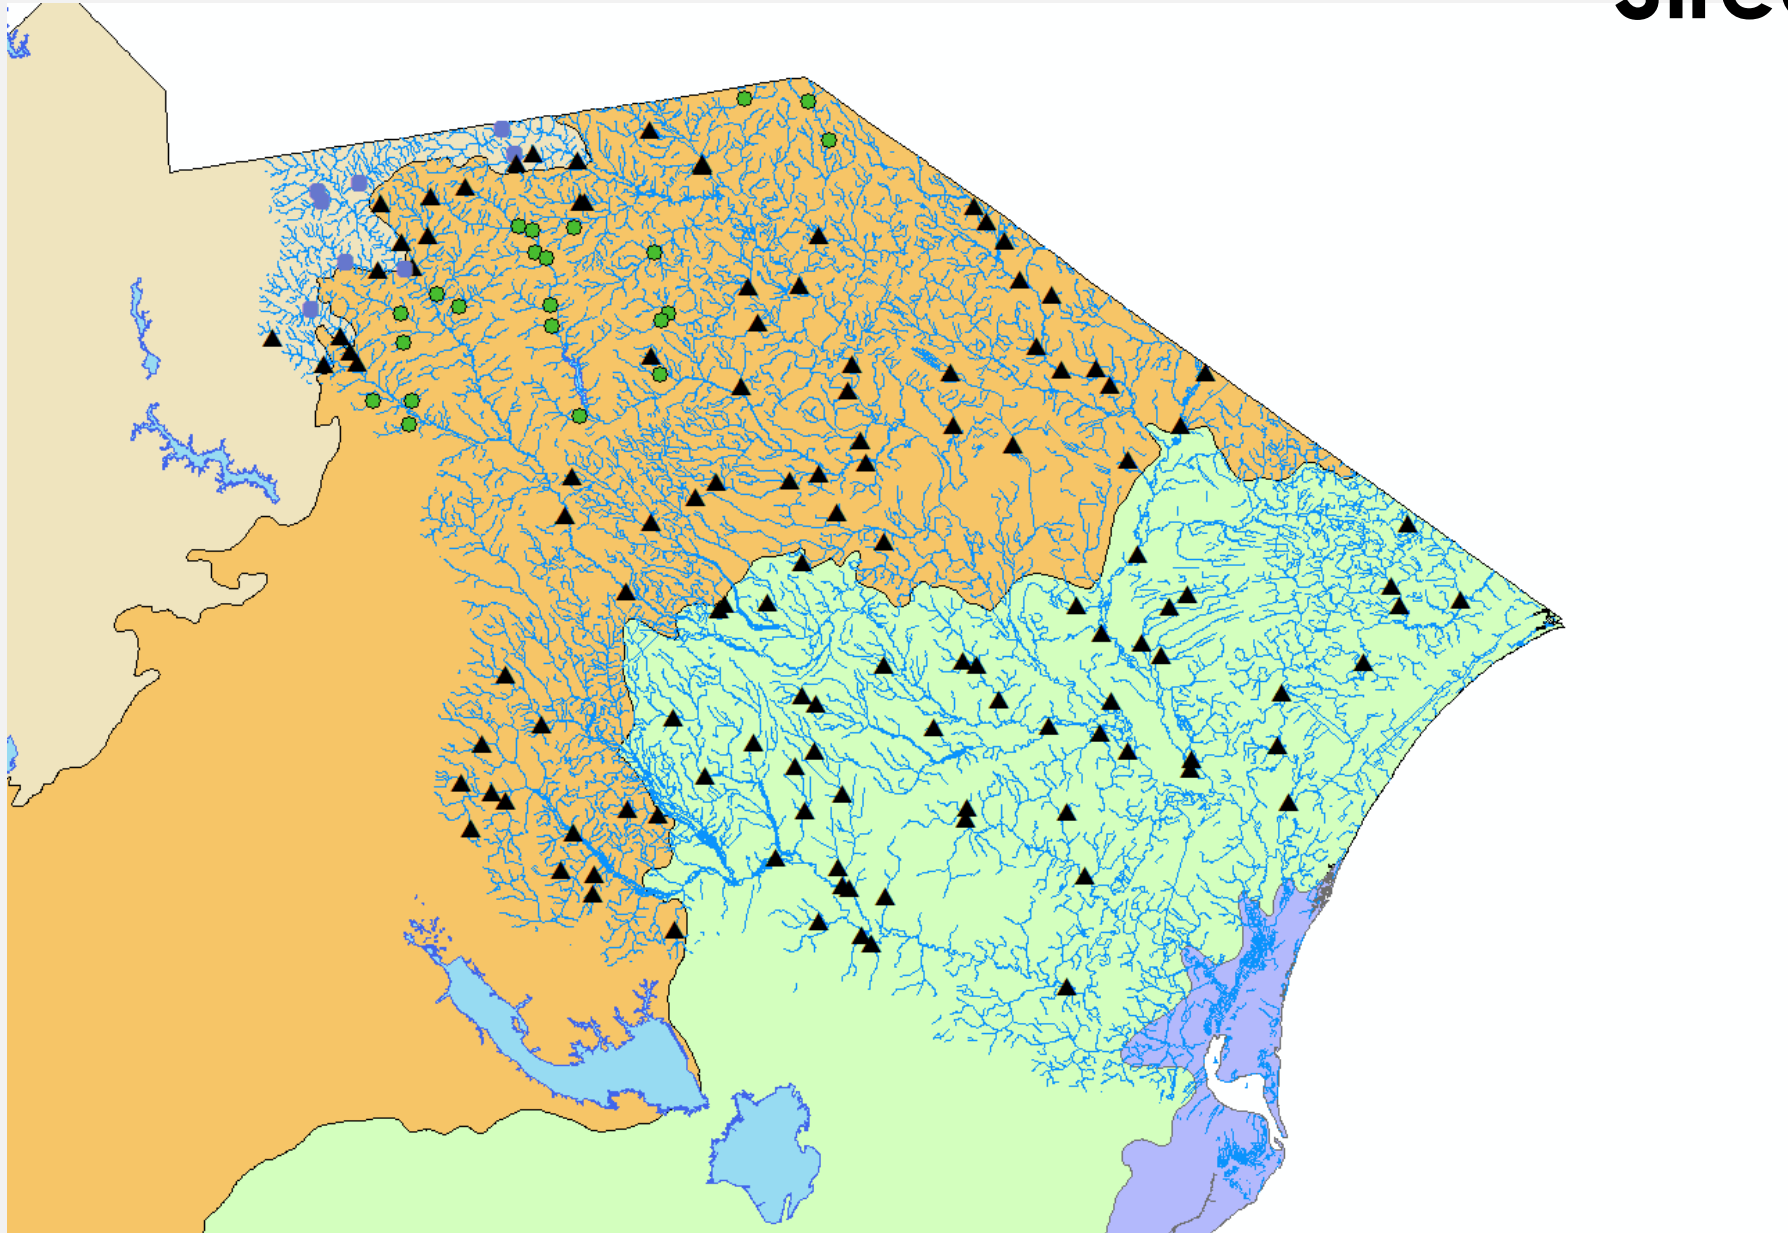

Standard Error

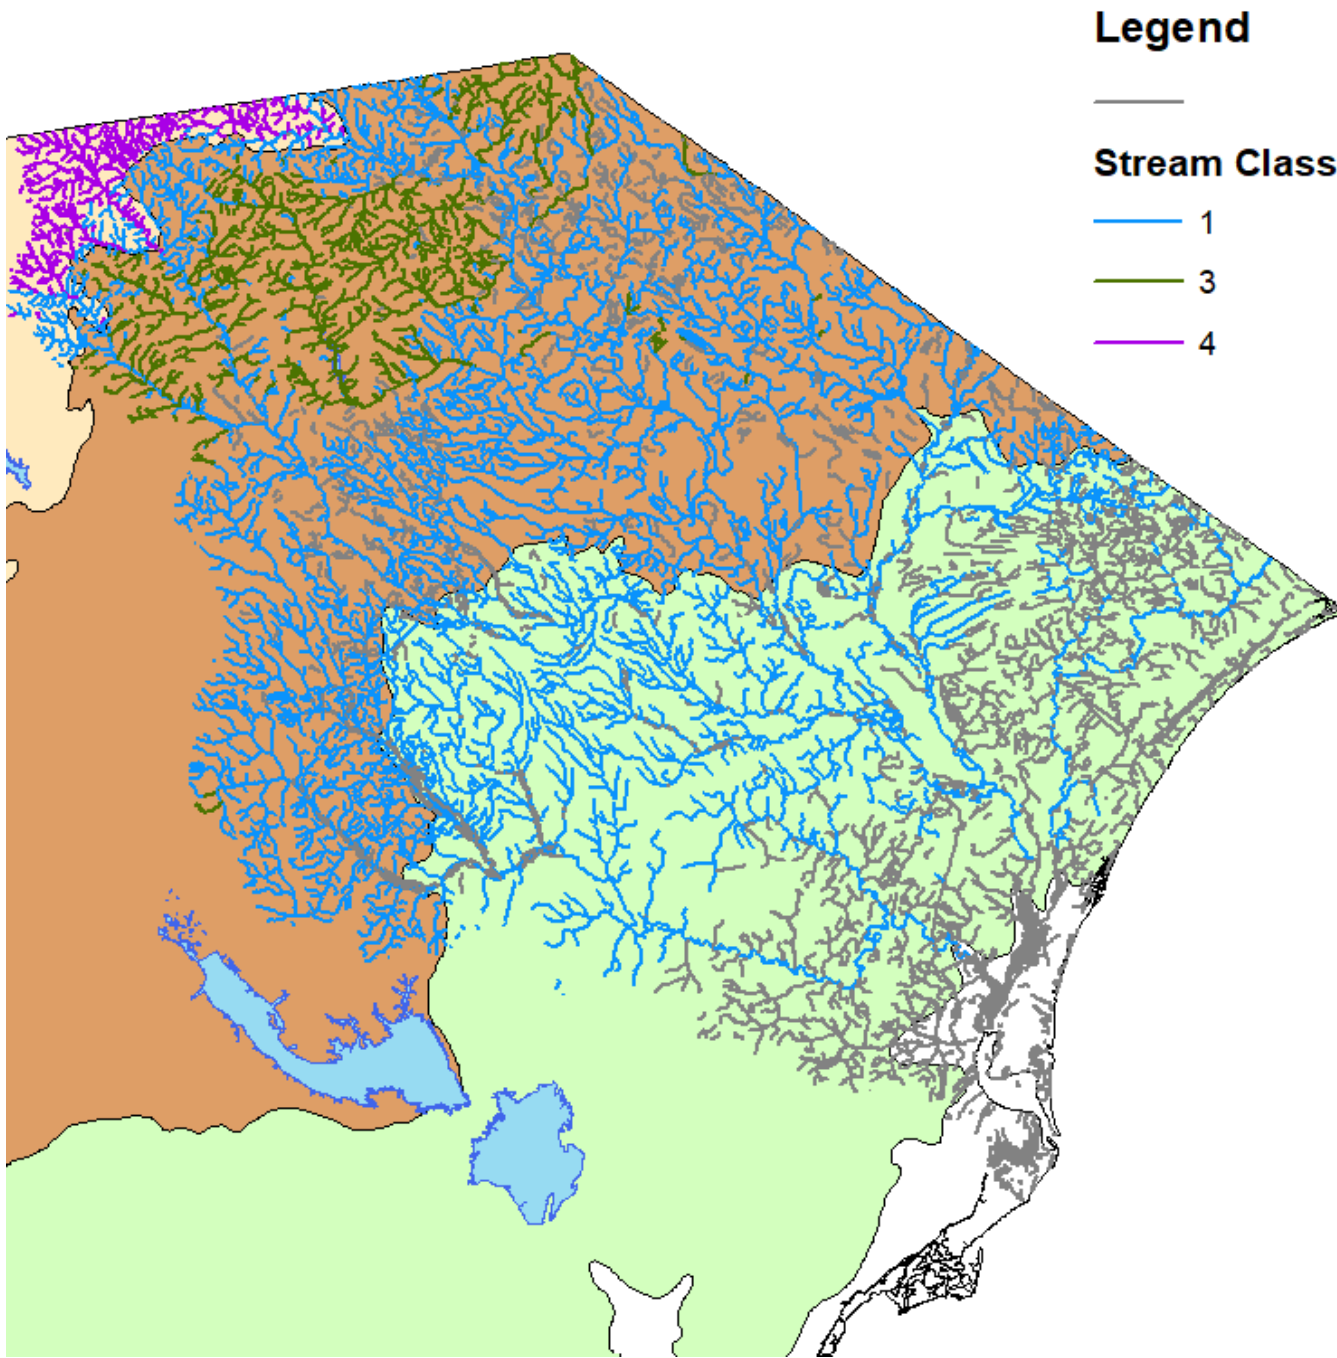

Colored lines correspond to scenario results shown in the table

Dashed red and blue lines separate the low medium and high risk zones

★ Perennial Runoff

Fish Richness-MA1: SE Plains: Perennial Flashy

- Removal of 20% of mean daily flow is 'low risk'
- Removal of more than 40% is 'high risk' to fish richness

Black Creek near Quinby

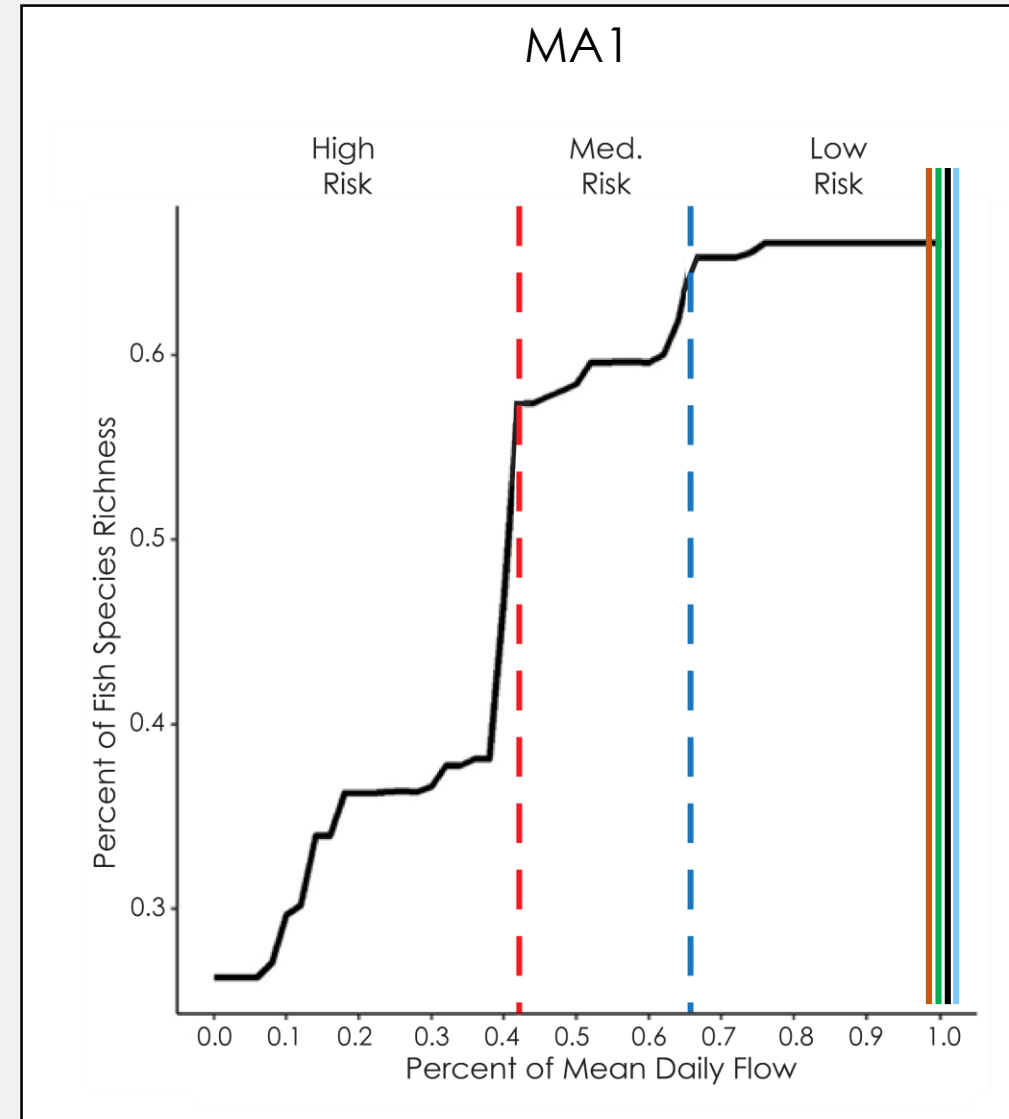

Scenario	Current	Predicted	% change	Change in Bio	SE

Summary

- Analyzed 4 flow metrics across 5 sites
- Analyzed 3 biotic responses
- Generally, very little change is predicted

Summary of Changes in Flow Metrics

Summary of Changes in Biotic Metrics

A scenic view of a river with many large, flat rocks protruding from the water, surrounded by a dense green forest. The water is clear and flows over the rocks, creating small rapids and pools. The forest is lush and green, with many trees and bushes. The overall scene is peaceful and natural.

Some implications of this work

Expected results: richness

- 65 species collected at 94 sites in Pee Dee basin
- Average 12 species per site

Redbreast sunfish

Notchlip redhorse

Blackbanded sunfish

Bluespotted Sunfish

Least Killifish

American Eeel

Expected results: richness

- Up to 39% biodiversity loss in some streams at full allocation
- Replacement by common generalists & invasives

Green sunfish

Eastern mosquitofish

White sucker

Yellow Bullhead

Golden Shiner

37 Species of Greatest Conservation Need

Thinlip Chub

Santee Chub

Carolina Darter

Pinewoods Darter

Rosyside Dace

Bluespotted Sunfish

Fieryblack Shiner

Everglades Pygmy Sunfish

Snail Bullhead

Carolina Fantail Darter

Blackbanded Sunfish

Sandhills Chub

37 Species of Greatest Conservation Need

Robust Redhorse

Shortnose Sturgeon

American Shad

Atlantic Sturgeon

Striped bass

American Eel

What this info is

- Guidance based on best available data and analysis tools
- Based on models with compounding statistical uncertainty

What this info is not

- Arbitrary recommendations from 'expert advice'
- Perfect.
- More data = less uncertainty
- Changing climate & land cover = more uncertainty

What this info is

- Guidance based on best available data and analysis tools
- Based on models with compounding statistical uncertainty
- Representative of overall (30-year) flow regime characteristics

What this info is not

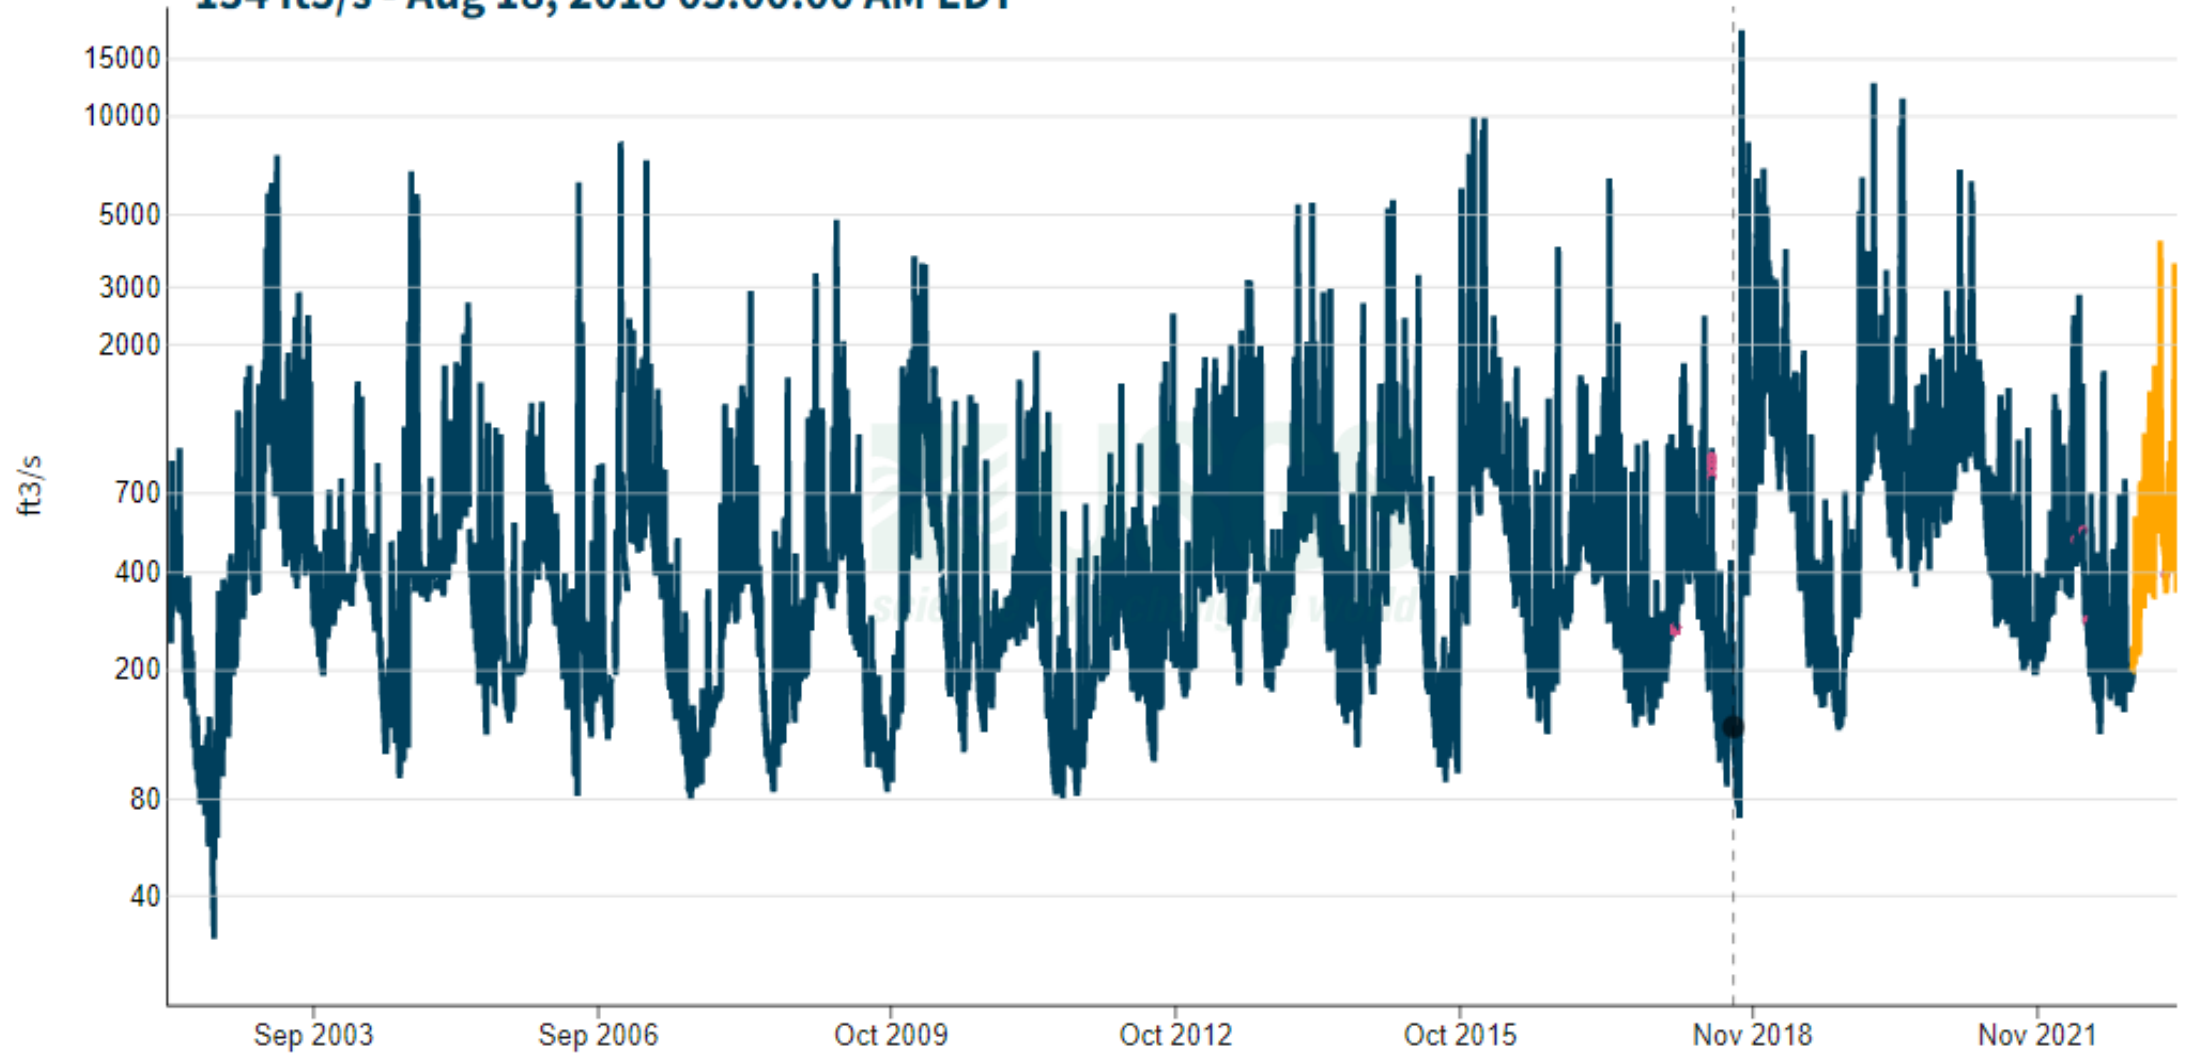

- Arbitrary recommendations from 'expert advice'
- Perfect.
- More data = less uncertainty
- Changing climate & land cover = more uncertainty
- One-time withdrawal thresholds

Lynches River Near Bishopville, SC - 02131500

February 15, 2002 - April 20, 2023

Streamflow, ft³/s ⓘ

134 ft³/s - Aug 18, 2018 03:00:00 AM EDT

What this info is

- Guidance based on best available data and analysis tools
- Based on models with compounding statistical uncertainty
- Representative of overall (30-year) flow regime characteristics
- Applicable to streams and small rivers (~86% of all SC waters)
- Relationships between organisms and flow

What this info is not

- Arbitrary recommendations from 'expert advice'
- Perfect.
- More data = less uncertainty
- Changing climate & land cover = more uncertainty
- One-time withdrawal thresholds
- Applicable to large rivers and reservoirs
- Parsing out other factors that affect organisms
- Land use affects flow, etc.

Outstanding questions

- **Parsing out multiple stressors:** Fish are affected by flow and other features—land use, etc.
- **Needs:** Analyses are in progress to answer this question

- **Future flows:** Relationships are based on ‘current’ flow-ecology relationships.
- **Needs:** Detailed dataset of predicted future flow. Accounting for land use, temp, & precip.

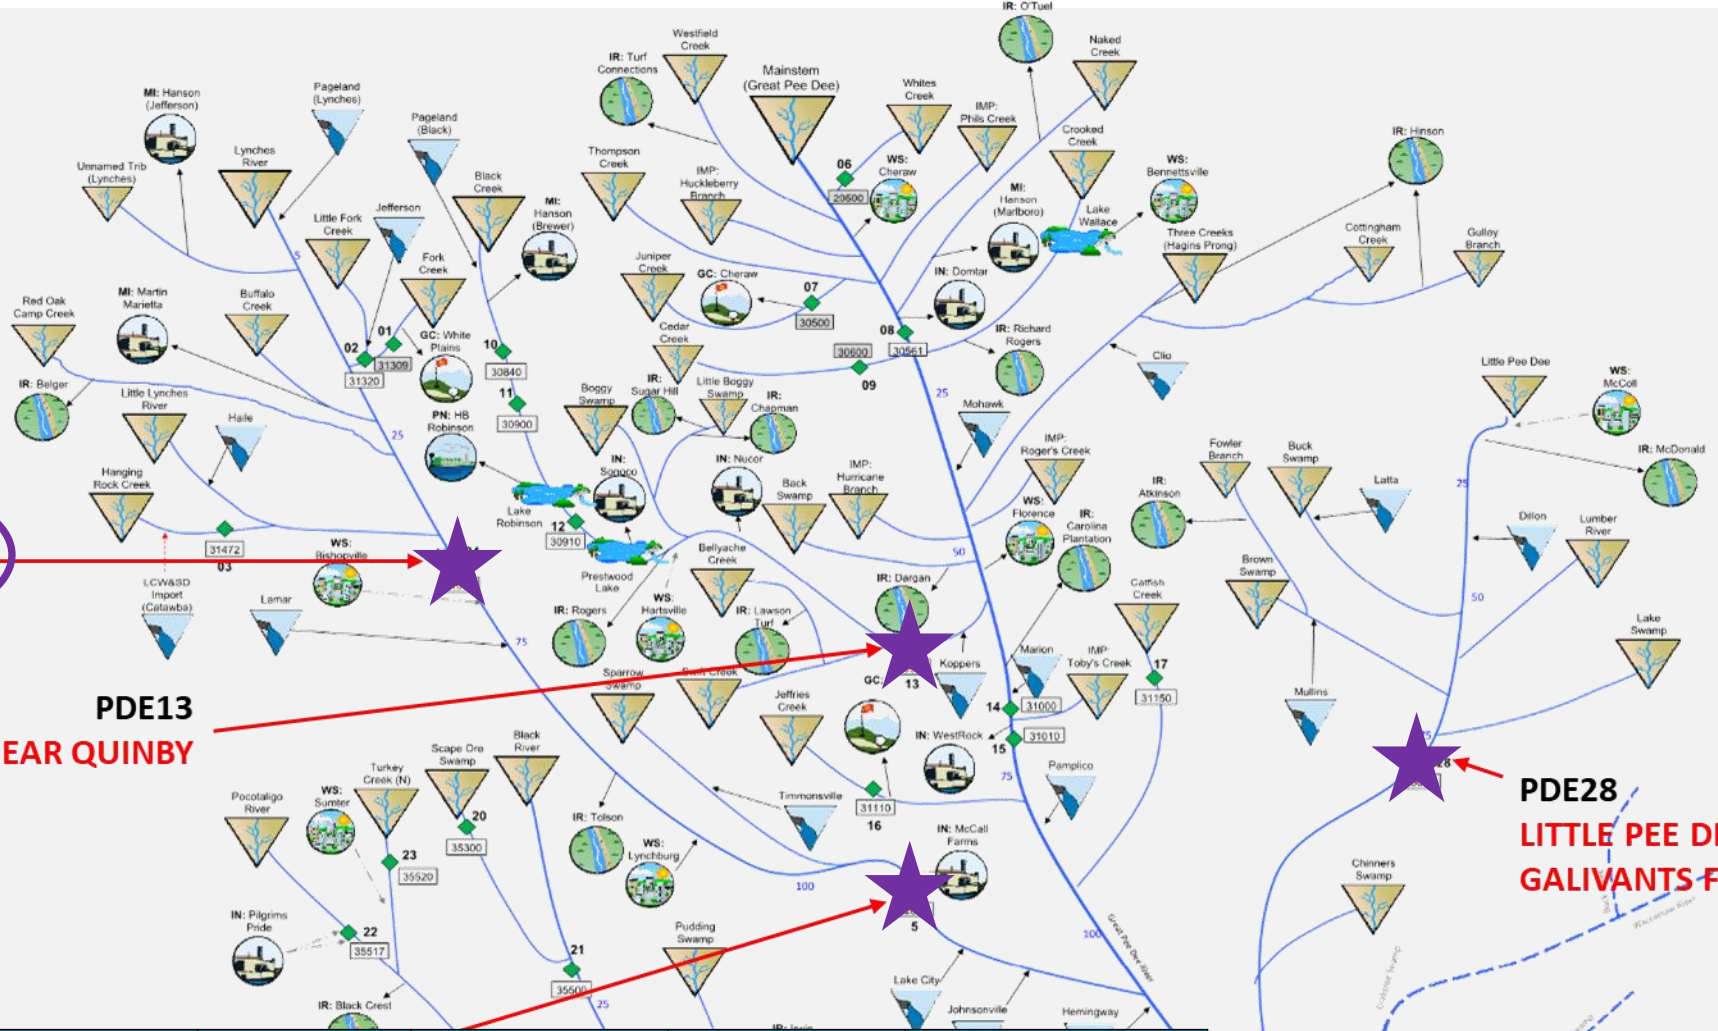

- **Large rivers & reservoirs:** Most major withdrawals occur outside our focal streams
- **Needs:** Species-level population data from these systems across the state

- **Flow effects on SGCNs:** Species-specific relationships can provide more detailed recommendations
- **Needs:** Personnel time.
